American Indian and Alaska Native Population

- Approximately 2% of the U.S. population – 6.6 million Americans – self-identify as having American Indian/Alaska Native (AI/AN) heritage. ¹
- About two-thirds live in urban, suburban, or rural non-reservation areas; about one-third live on reservations. ¹
- As of 2017, there are currently 567 federally-recognized AI/AN tribes; they are culturally diverse and speak more than 200 languages. ¹
- Newly born AI/ANs have a life expectancy that is 4.4 years less than the rest of the nation—73.7 years compared with 78.1 years, respectively. ²
- AI/ANs have the highest poverty rate of any race/ethnic group, with 26.6% living in poverty (The national poverty rate is 14.7%). ¹
- Approximately 21% of single-race AI/ANs lack health insurance coverage in 2015 as compared with 9.4% of the general US population who lacked health insurance coverage. ¹
Mental Health Status and Disparities

Research indicates that AI/AN populations have disproportionately higher rates of mental health problems than the rest of the US population. High rates of substance use disorders (SUDs), posttraumatic stress disorder (PTSD), suicide, and attachment disorders in many AI/AN communities have been directly linked to the intergenerational historical trauma forced upon them, such as forced removal off their land and government-operated boarding schools which separated AI/AN children from their parents, spiritual practices, and culture.

- In 2014, approximately 21% of AI/ANs ages 18 and up reported past-year mental illness, compared with 17.9% for the general population.
- AI/AN children and adolescents have the highest rates of lifetime major depressive episodes and highest self-reported depression rates than any other ethnic/racial group.
- In 2014, suicide was the second leading cause of death for AI/ANs between the ages 10 and 34. Suicide was the leading cause of death for AI/AN girls between ages of 10 and 14; in AI/AN females from ages 15 to 19, rates of completed suicides were almost 4 times higher than white females counterparts.
- In 2014, approximately 9% of AI/ANs ages 18 and up had co-occurring mental illness and substance use disorder in the past year—almost three times that of the general population.
- The overall rate of alcohol consumption among AI/AN (43.9%) is significantly lower than the national average (55.2%). However, there are differences by age and region and tribe, with some tribes having distinctly higher and lower rates.
- National data shows a higher prevalence and earlier initiation of drug and alcohol use among AI/AN youth ages 17 and younger, compared with all other races/ethnicities.

Mental Health Service Utilization

Mental health service utilization rates for AI/ANs are low, which is likely due to a combination of factors, including stigmatization of mental health, lack of culturally trained providers, and lack of available services.

Cultural Health Practices of American Indians/Alaska Natives

Traditional healing systems are important in the treatment of AI/AN communities. These systems focus on balancing mind, body, and spirit via a connection with place and land. Some AI/AN populations believe that traditional-based healing practices have potential to help address mental health care needs within their communities. Research shows that Indigenous men and women who meet criteria for depression/anxiety or substance use disorder are significantly more likely to seek help from traditional/spiritual healers than from other sources.

Protective Factors are concepts that are key to the “cultural context, identity, adaptability, and perseverance” of AI/ANs. Protective Factors include holistic approaches to life, a desire to promote the well-being of the group, an enduring spirit, and respect for all ways of healing.

Strengths and protective factors common to AI/ANs include:
- A strong identification with culture
- Family
- Enduring spirit (stubborn, hard to accept change)
- Connection with the past
- Traditional health practices (e.g., ceremonies)
- Adaptability
- Wisdom of elders
Some key protective factors against suicide attempts among AI/AN youth include:

- Discussion of problems with family or friends,
- Connectedness to family
- Emotional health

**Barriers to Accessing Mental Health Services**

Key barriers to accessing mental health treatment for AI/ANs include:

- Economic barriers (cost, lack of insurance)
- Lack of awareness about mental health and available services
- Stigma associated with mental illness
- Lack of culturally sensitive mental health services
- Mistrust of health care providers
- Lack of appropriate intervention strategies (including integration of mental health and primary health care services)
