The APA is offering a number of "emerging measures" for further research and clinical evaluation. These patient assessment measures were developed to be administered at the initial patient interview and to monitor treatment progress. They should be used in research and evaluation as potentially useful tools to enhance clinical decision-making and not as the sole basis for making a clinical diagnosis. Instructions, scoring information, and interpretation guidelines are provided; further background information can be found in DSM-5. The APA requests that clinicians and researchers provide further data on the instruments' usefulness in characterizing patient status and improving patient care at http://www.dsm5.org/Pages/Feedback-Form.aspx.

Measure: LEVEL 2—Somatic Symptom—Adult Patient (adapted from the Patient Health Questionnaire Physical Symptoms [PHQ-15]) **Rights granted:** This measure can be reproduced without permission by researchers and by clinicians for use with their patients. **Rights holder:** This measure was adapted from the Patient Health Questionnaire Physical Symptoms (PHQ-15]), which is in the public domain (http://www.phqscreeners.com/instructions/instructions.pdf). The original measure was developed by Drs. Robert L. Spitzer, Janet B.W. Williams, Kurt Kroenke and colleagues, with an educational grant from Pfizer Inc. **To request permission for any other use beyond what is stipulated above, contact:** The measure is in the public domain and can be used without permission.

If the measure is being completed by an informant, what is your relationship with the individual receiving care?

In a typical week, approximately how much time do you spend with the individual receiving care? ______ hours/week

Instructions: On the DSM-5 Level 1 cross-cutting questionnaire that you just completed, you indicated that *during the past 2 weeks* you (the individual receiving care) have been bothered by "unexplained aches and pains", and/or "feeling that your illnesses are not being taken seriously enough" at a mild or greater level of severity. The questions below ask about these feelings in more detail and especially how often you (the individual receiving care) have been bothered by a list of symptoms **during the past 7 days.** Please respond to each item by marking (\checkmark or x) one box per row.

: he <u>past 7 days</u>, how much have you been both omach pain	ered by any of t Not bothered at all (0)	Bothered a little	roblems? Bothered a lot	Item Score

Adapted from Physical Symptoms (PHQ-15) for research and evaluation purposes.

Instructions to Clinicians

The DSM-5 Level 2—Somatic Symptom—Adult measure is an adaptation of the 15-item Patient Health Questionnaire Physical Symptoms (PHQ-15) that assesses the domain of somatic symptoms. The measure is completed by the individual (or his or her informant) prior to a visit with the clinician. If the individual is of impaired capacity and unable to complete the form (e.g., an individual with dementia), a knowledgeable informant may complete the measure. Each item asks the individual (or informant) to rate the severity of the individual's somatic symptom <u>during the past 7 days</u>.

Scoring and Interpretation

Each item on the PHQ-15 is rated on a 3-point scale (0=not bothered at all; 1=bothered a little; 2= bothered a lot). The total score can range from 0 to 30, with higher scores indicating greater severity of somatic symptoms. The clinician is asked review the score of each item on the measure during the clinical interview and indicate the raw score for each item in the section provided for "Clinician Use." The raw scores on the 15 items should be summed to obtain a total raw score and interpreted using the Interpretation Table for the PHQ-15 Somatic Symptom Severity scale below:

Interpretation Table for the PhQ-13 Somatic Symptom Sevency scale				
Levels of Somatic Symptom Severity	PHQ-15 Score			
Minimal	0-4			
Low	5-9			
Medium	10-14			
High	15-30			

Interpretation Table for the PHQ-15 Somatic Symptom Severity scale

Note: If 4 or more items are left unanswered on the PHQ-15 (i.e., more than 25% of the total items are missing) the total score should not be calculated. As such, the individual (or informant) should be encouraged to complete all of the items on the measure. If 1 to 3 items are left unanswered, you should prorate the raw score by first summing scores of items that were answered to get a **partial raw score**. Next, multiply the partial raw score by the total number of items on the measure (i.e., 15). Finally, divide the value by the number of items that were actually answered to obtain the prorated total raw score.

Prorated Score = (Partial Raw Score x number of items on the PHQ-15) Number of items that were actually answered

If the result is a fraction, round to the nearest whole number.

The prorated total raw score should be interpreted using the Interpretation Table for the PHQ-15 Somatic Symptom Severity scale above.

Frequency of Use

To track change in the severity of the individual's somatic symptom over time, the measure may be completed at regular intervals as clinically indicated, depending on the stability of the individual's symptoms and treatment status. For an individual of impaired capacity, it is preferred that completion of the measure at follow-up appointments is by the same knowledgeable informant. Consistently high scores on a particular domain may indicate significant and problematic areas for the patient that might warrant further assessment, treatment, and follow-up. Your clinical judgment should guide your decision.
