<td>None</td>
</tr>
<tr>
<td><strong>Rationale</strong></td>
<td>Individuals with bipolar disorder or major depression have high rates of co-morbid substance abuse and should be screened for substance use disorders. Between 40-70% of people with bipolar disorder have a history of substance use disorder. A current or past co-morbid substance use disorder may lead to worse outcomes for bipolar disorders, including more symptoms, more suicide attempts, longer episodes and lower quality of life. Substance abuse may obscure or exacerbate mood swings that have no other apparent external cause. Substance abuse may also precipitate mood episodes or be used by patients to self-treat in an attempt to improve the symptoms of episodes. Patients suffering from major depressive disorder with co-morbid addiction are more likely to require hospitalization, more likely to attempt suicide and less likely to comply with treatment than are patients with these disorders of similar severity not complicated by these factors.</td>
</tr>
<tr>
<td><strong>Clinical Recommendation Statement</strong></td>
<td>Perform a diagnostic evaluation to assess the presence of an alcohol or substance use disorder or other factors that may contribute to the disease process or complicate its treatment. A complete diagnosis of depression should address history of substance use and treatment for substance use disorders.</td>
</tr>
<tr>
<td><strong>Improvement Notation</strong></td>
<td>Higher score indicates better quality</td>
</tr>

</table>
| **Guidance** | The intent of the measure is that the assessment be performed for a single episode for each patient. Due to current limitations of the eMeasure specification system, it is possible for there to be up to two treatment episodes per patient, identified through up to two index episodes. As a result, the numerator criteria of this measure can be satisfied if a substance use assessment is performed within either treatment episode. Future versions of the measure should address this issue.  
A BH Outpatient Psychotherapy encounter meets the intent of both an encounter and a treatment. |
| **Transmission Format** | TBD |
Initial Population

Patients 18 years of age or older at the start of the measurement period with a new diagnosis of unipolar depression or bipolar disorder during the first 323 days of the measurement period, and evidence of treatment for unipolar depression or bipolar disorder within 42 days of diagnosis. The existence of a 'new diagnosis' is established by the absence of diagnoses and treatments of unipolar depression or bipolar disorder during the 180 days prior to the diagnosis.

Denominator

Equals Initial Population

Denominator Exclusions

None

Numerator

Patients in the denominator with evidence of an assessment for alcohol or other substance use following or concurrent with the new diagnosis, and prior to or concurrent with the initiation of treatment for that diagnosis

Numerator Exclusions

Not Applicable

Denominator Exceptions

None

Supplemental Data Elements

For every patient evaluated by this measure also identify payer, race, ethnicity, and sex
